DESCRIPTION
Surfactant admixture to entrain micro air bubbles in concrete exposed to freeze/thaw cycles.

WHERE TO USE
Mapeair AE 20 may be used to great advantage if used in the following applications:

• durable concrete exposed to thermal fluctuations around freezing point;
• lean concrete (cement content less than 250 kg/m³) with a low fine sand content for pumping;
• concrete with lightweight aggregates to improve the homogeneity, workability and application of the mix.

Some application examples
There are various application examples, including the following:

• hydraulic works (such as dams, water channels, swimming pools, storage tanks) exposed to cold climates;
• floors, floor slabs, tunnels and car parks exposed to rainwater and cold climates;
• lightweight structural concrete elements (panels, floor beams, etc.).

TECHNICAL CHARACTERISTICS
The main technological characteristics of cementitious mixes with aerating agents are as follows:

• resistance to freeze-thaw cycles;
• better pumping properties for lean concrete with a low fine sand content;
• lower segregation in concrete made from lightweight aggregates.

Mortar and concrete do not have the capacity to resist to cyclic stresses deriving from alternating freeze/thaw cycles. In fact, the formation of ice, which leads to an increase in volume (approximately 9%), provokes high stresses in mortar and concrete saturated with water or exposed to rainwater (open-air car parks, airport runways, tunnels, etc). In these cases, the most efficient form of prevention to contrast fatigue failure due to freeze/thaw cycles is to absorb a small volume of air (3-6%) in the form of stable micro bubbles with a diameter of between 100 and 300 µm and at an even pitch of between 100 and 300 µm: in such conditions, when the first ice crystals form, the increase in volume deriving from them pushes the water in liquid form which has not yet frozen into the adjacent micro bubbles to ease the internal stresses. In the phase after thawing, the capillary suction effect causes the water to be released by the micro bubbles and to flow towards the pores in the surrounding cementitious mix. This movement leaves the micro bubbles empty and ready to host water in the freezing state again the next time the natural thermal cycle comes around.

As well as helping to reduce the effect of the stresses caused by the formation of ice, unfortunately the absorbed micro air bubbles reduce the strength of the

Concrete by about 20%. Therefore, the water/cement ratio must be reduced to increase the strength of the concrete to compensate for this reduction due to air bubbles being absorbed.

For this reason, the use of Mapeair AE 20 in concrete resistant to freeze/thaw cycles must always be accompanied by the use of a super-plasticising agent (Dynamon or Chronos) according to the performance characteristics required.

Thanks to the development of deformable, spherical micro air bubbles, Mapeair AE 20 compensates for the lack of fine-grained material in the sand (100-300 µm) which is indispensable for pumping purposes, especially in the case of lean concrete with a low cement content. Also, by absorbing air in concrete made using expanded clay or polystyrene, there is a reduction in the tendency of the aggregates to “float” (segregation) due to the lower difference between the density of the aggregates and the cementitious mix, which is also lightened. As a result, the conglomerate is more homogenous and, therefore, the thermo-insulating characteristics are also more uniform.

### RECOMMENDATIONS

Do not use Mapeair AE 20 without checking the volume of air which develops in the concrete with a porosimeter.

### HOW TO USE

To produce concrete resistant to freeze/thaw cycles, the dose of Mapeair AE 20 to absorb the volume of air required according to the maximum diameter of the aggregate, must be checked by carrying out preliminary testing at the cement mixing plant using the same ingredients (cement, sand, large aggregates, etc.) as will be used for constructing the structure.

As a general rule, the dose of Mapeair AE 20 varies from 0.2 to 0.8 l every 100 kg of binder (cement plus fly ash or silica fume). In fact, the exact dosage to obtain the volume of air required in the concrete to be cast depends on the following parameters:

- the form of the aggregates (round or crushed);
- the grain size of the sand;
- workability;
- mixing time and efficiency;
- transport time;
- constipation method.

We recommend that the Mapeair AE 20 is added together with the mixing water and is then thoroughly mixed for a few minutes to favour development of the volume of air required. The aerating effect, which must be checked with a porosimeter, is more efficient if the concrete is more fluid.

If a super-plasticising additive is used, such as Dynamon or Chronos, or a fly ash or silica fume-based product, the dose of Mapeair AE 20 must be slightly higher to get the same volume of air as normal concrete.
We recommend adding Mapeair AE 20 separately from the other additives.

**COMPATIBILITY WITH OTHER PRODUCTS**
Mapeair AE 20 is compatible with a number of additives. Its use is particularly recommended with super-plasticisers from the Dynamon or Chronos ranges.

When curing structures without formwork (such as floors), we recommend applying curing agents from Mapecure range immediately after casting concrete containing Mapeair AE 20. In structures with formwork which is stripped off very quickly (after 1 to 3 days), the curing agent must be applied immediately after removing the formwork. We recommend the use of releasing agents from DMA or Mapeform Eco range to demould concrete with Mapeair AE 20.

**CONSUMPTION**
Mapeair AE 20 is used at a rate of from 0.2 to 0.8 litres every 100 kg of binder. Slightly higher doses may be used in concrete containing fly-ash, silica fume and super-plasticising admixtures.

**PACKAGING**
Mapeair AE 20 is available in bulk quantities, 1000 litre tanks, 200 litre drums and 25 kg cans.

**STORAGE**
Mapeair AE 20 may be stored for up to 12 months in sealed containers protected from frost.

**SAFETY INSTRUCTIONS FOR PREPARATION AND APPLICATION**
Mapeair AE 20 is not considered hazardous according to current norms and guidelines regarding the classification of mixtures. However, it is recommended to wear protective gloves and goggles and to take the usual precautions for handling chemicals. For further and complete information about the safe use of our product please refer to the latest version of our Material Safety Data Sheet.

**PRODUCT FOR PROFESSIONAL USE.**

**WARNING**
Although the technical details and recommendations contained in this product data sheet correspond to the best of our knowledge and experience, all the above information must, in every case, be taken as merely indicative and subject to confirmation after long-term practical application; for this reason, anyone who intends to use the product must ensure beforehand that it is suitable for the envisaged application. In every case, the user alone is fully responsible for any consequences deriving from the use of the product.
