AREA OF USE
Rescon T® is an anti-washout admixture in powder form, for use with under water concrete and mortar.

PROPERTIES
Addition of Rescon T® makes concrete suitable for all types of underwater applications:
- The cohesiveness of the concrete increases which prevents washout of cement, and does not cloud the water and reduce visibility during placement
- The concrete is stabilised, separation in water is prevented
- The concrete becomes self-compacting
- Stability of concrete during pumping is ensured
- Flow properties are enhanced

Can be used for all underwater concrete, irrespective of application:
- Constructions
- Concrete bases
- Repairs and renovation

Underwater concrete containing Rescon T® is suitable for all the usual methods of underwater placement:
- Pumping
- Tremie
- Bucket and crane
- Concrete chute
- Sack method

DOSAGE
The normal dosage of Rescon T® is from 4 to 6 kg/m³.

FORMULATION TESTS
The proportioning of underwater concrete must always be specific to the materials used and the methods of production and application. The choice of composition is based upon the documentation of working properties of trial batches. In certain cases trial casting underwater should be performed for verification of concrete characteristics, and to ensure that the combination of concrete and working equipment functions satisfactorily. The picture below shows how the operation and the flow properties are controlled in an L-shaped form.

L-box for testing
Rescon T®

Good workability
T-concrete:
slump flow
> 550 mm
As a basic principle, a representative from Mapei AS should give advice during the formulation of under water concrete, if the concrete suppliers themselves do not have the necessary experience.

UNDERWATER CASTING
The concrete should have as little contact with water as possible during the operation. When in contact with water the flow of concrete must be as even and steady as possible.

Generally, placement by pumping is emphasised as a more reliable method than conventional tremie, because the concrete can be subjected to greater forces than those of gravity alone. The placement pipe can then be used at greater depths, which gives a more favourable flow profile with less risk of sedimentation.

The difference between the two methods is particularly large, in favour of pumping, for placement in shallow water, i.e. with shorter pipes. The risk of airlock formation is also eliminated. Pumping, in most cases, also gives a higher rate of placement, resulting in a faster build up.

The flow properties of underwater concrete with Rescon T® can be adjusted with all types of superplasticising admixtures, except for those which are naphthalene based.

PACKAGING
Rescon T® is delivered in 10 kg bags.

STORAGE
The product has a minimum shelf life of 1 year when stored dry, in original unopened packaging.

SAFETY INSTRUCTIONS FOR PREPARATION AND USE
Rescon T® is not considered dangerous according to European regulations regarding classification of chemicals. It is recommended to wear gloves and goggles and to take usual precautions for handling of chemicals.

For further and complete information about the safe use of our product please refer to the latest version of our Material Safety Data Sheet.

PRODUCT FOR PROFESSIONAL USE

WARNING
The technical recommendations and details in this product description represent our current knowledge and experience of the products. All the above information should be treated as a guide and full consideration should be given. Anyone using the product must ensure that it is suitable for the intended purpose before use. The manufacturer cannot be held liable for use of the product for purposes for which it is not recommended or in the event of accidental use.

Please refer to the most recent version of the technical data sheet on our website at www.mapei.no
