Ultrabond ECO 907 is a fast-curing, 100%-solids, moisture-curing, gun-grade adhesive designed for basic wood subfloor construction practices as well as repairing of wood flooring; bonding of wood stair nosings; installation of wood molding and baseboards; and attachment of tackstrips to concrete subfloors. Ultrabond ECO 907 is also ideal for supplemental bonding of wide plank boards when nailing and gluing are required.

**FEATURES AND BENEFITS**
- 2-hour curing time
- High bond strength
- Excellent elongation properties

**WHERE TO USE**
- For the bonding of most common construction materials, such as plywood to lumber framing, engineered and solid wood flooring, wood moldings and baseboards, carpet tackstrips and polystyrene insulation boards
- Interior residential (rental apartments, condominiums and homes)
- Interior commercial (office buildings, hotel rooms/hallways and restaurant dining areas)
- Interior heavy commercial (hotel lobbies, convention centers, airports and department stores)
- Interior institutional (hospitals, schools, universities, libraries and government buildings)

**LIMITATIONS**
- Do not install over any substrates containing asbestos.
- Do not apply over any adhesive residues including cutback adhesive.
- Install only when the substrate temperature is between 20°F and 100°F (-7°C and 38°C). Low temperatures and low humidity will extend curing times.
- Do not use as a substitute for screws when installing plywood subfloors. All plywood subfloors must be installed according to APA or CANPLY Group 1 guidelines.

**SUITABLE SUBSTRATES**
- Exterior-grade plywood and other approved wood underlayments (per flooring manufacturer recommendations)
- Concrete and cement terrazzo
- Ceramic tile
- Cement-based, self-leveling underlayments and patching compounds
- Properly primed gypsum underlayments that meet the requirements for compressive strength according to ASTM F2419
- Radiant-heating systems that have been properly installed

Consult MAPEI’s Technical Services Department for installation recommendations regarding substrates and conditions not listed.

**SURFACE PREPARATION**
- All substrates must be structurally sound, dry, solid and stable.
• Substrate should be clean and free of dust, dirt, oil, grease, curing agents, concrete sealers, loosely bonded toppings, loose particles, old adhesive residues, and any other substance or condition that may prevent or reduce adhesion.

• Concrete and cement-based underlayments and patches must be fully cured and free of any hydrostatic and/or moisture problems.

See the “Surface preparation requirements” reference guide in the Related Documents section of the Floor Covering Installation Systems page on MAPEI’s Website.

**MIXING**

Before product use, take appropriate safety precautions. Refer to the Safety Data Sheet for details.

• Ready to use; no mixing is necessary.

**PRODUCT APPLICATION**

Read all installation instructions thoroughly before installation.

1. Insert the Ultrabond ECO 907 cartridge into a suitable caulk gun or insert the Ultrabond ECO 907 sausage pack into an appropriate dispensing gun.

2. Cut the tip and puncture the inner seal.

3. Apply a serpentine bead of adhesive to the substrate.

4. Only apply as much adhesive as can be installed within 15 to 30 minutes under normal temperature and humidity conditions.

5. Curing time may be accelerated by a light misting of water over the extruded adhesive before installation of the materials to be bonded. (Do not puddle water.)

**CLEANUP**

• Immediately clean tools with mineral spirits while the adhesive is still fresh/wet.

• Immediately clean any adhesive smudges from the flooring material’s surface with mineral spirits while the adhesive is still fresh/wet.

• Dried Ultrabond ECO 907 residue may be removed by gently rubbing with a white cloth to remove excess and then wiping lightly.

**PROTECTION**

• Protect from light traffic for at least 12 hours. Protect from heavy traffic for at least 24 hours.

• Building owners should be advised of the wood flooring manufacturer’s guidelines for climate control settings (temperature and humidity). These conditions must be monitored and kept constant in order to ensure the overall performance and long-term success of the installation.

* Flash time is the recommended amount of time for a freshly applied adhesive to remain exposed to the air before the bonding of materials.

** Working time is the maximum amount of time that an adhesive can remain exposed to the air and still effectively bond the materials together.

Note: Working time will vary based on temperature, humidity, substrate porosity and jobsite conditions.

**Packaging**

- Sausage pack: 20 U.S. oz. (591 mL)
- Plastic cartridge: 29 U.S. oz. (858 mL)
